

Evaluating question-guided reading

Experimental design

We compared three methods on two public datasets.

Participants were randomly assigned to the reading conditions.

Each trial lasted ten minutes with the same source material.

Earlier studies considered document navigation and search.

The data do not establish generalization to all disciplines.

A separate section describes the background of this work.

Synthetic fixture. Scores in the UI test are mocked, not Jev results.

SYNTHETIC FIGURE TEST / NOT REAL MODEL OUTPUT

The experiment compares three conditions. Participants were randomly assigned. The primary metric was reading time.

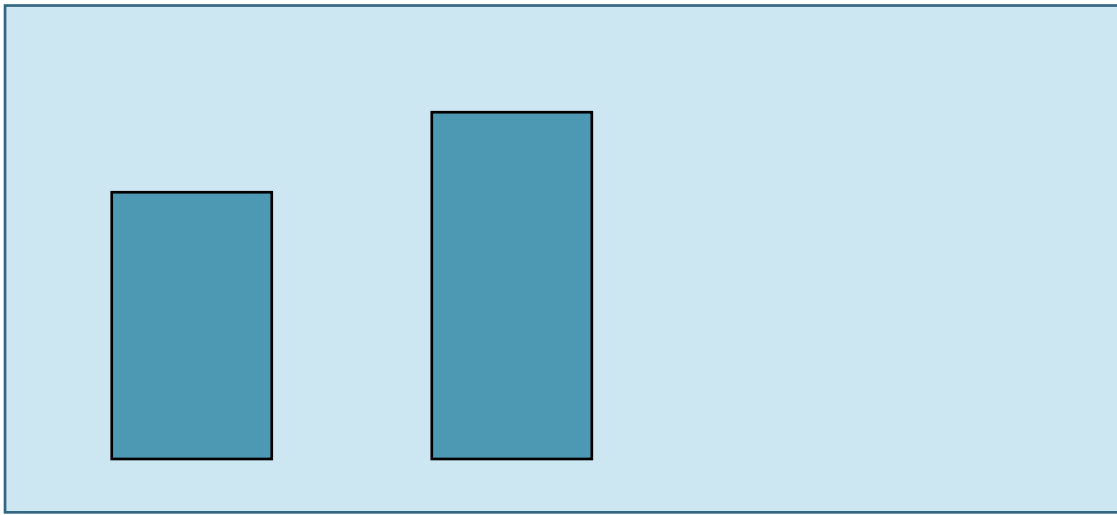

Figure 1. Experimental conditions and reading-time measurements.
